How to read this table. The columns are

1st:

textual *description* of the character

2nd:

character inserted directly into the HTML page as *one byte*

3rd:

character written as *numeric HTML entity*, in the format:
"how it looks literally" --> "what your browser does with it"

4th:

character written as *symbolic HTML entity*, in the format:
"how it looks literally" --> "what your browser does with it"

So for example, if you see something like "÷ --> ÷;" in the 4th column, this means your browser doesn't know about the entity name "divide" and just puts it literally.

This table grew out of an overview of the "ISO Latin-1 Character Set" overview related to the Hyper-G Text Format. The entity names `&brkbar;` and `Đ` seem to be unique to HTF. The entity name `&hibar;` has been supported by X Mosaic but seems to be replaced with `¯`. The entity names `¨` and `¨` should be equivalent.
