Re-ordering values

Why re-order values?

- JMP orders the values of variables alphabetically by default.
- Sometimes the alphabetical ordering of the values is not ideal for your needs.
- In logistic regressions, you may want to reverse the comparison of the outcome (y) values.
- In regressions, nominal predictor variables will be analyzed in comparison to the last value (as determined by "Value order"). You may want to change the comparison level by re-ordering: moving the value of your choice to the last position.

How to do it:

- Double-click on the column name in the table.
- Click Column Properties > Value ordering
- Select a value. Click Move up or Move down, or choose Reverse.
- Click OK
